

**AMENDMENTS TO THE CLAIMS:**

This listing of claims will replace all prior versions, and listings, of claims in the application:

1. (previously presented) Apparatus for selecting items from a product database, the apparatus comprising:

a display database for storing a set of display items;

data-storage means for storing attribute data items each associated with one or more of the display items;

data-storage means for storing a score value for each attribute data item;

means for displaying a subset of the display items selected from the display database;

means for receiving user inputs made during a browsing session;

means for amending the score values in response to the user inputs as said browsing session continues;

means for retrieving, from the data-storage means, attribute data items associated with any display item;

means for retrieving from the display database, one or more further display items selected in accordance with the score values associated with attribute data items; and

output means for displaying an output identifying the selected further display item or items during said browsing session.

2. (previously presented) Apparatus according to claim 1, further input means for receiving a user input identifying a first display item selected from the displayed subset, and

wherein the score values for each attribute data item can be altered as said browsing session continues in response to such user interaction.

3. (previously presented) Apparatus according to claim 1, wherein the means for retrieval operate on the basis of assigning an aggregate score to each display item based on the current score values of attribute data items associated with that display item.

4. (previously presented) Apparatus according to claim 2, wherein the means for retrieval comprises means for generating a probabilistic function, such that the current aggregate score of a display item determines the probability of its selection.

5. (previously presented) Apparatus according to claim 1, wherein provision is made for users to input both positive and negative reward values.

6. (previously presented) Apparatus according to claim 1, wherein the data storage means comprises means for storing real value weights associating attribute data items with display items.

7. (previously presented) Apparatus according to claim 1, wherein the display includes non-visual elements.

8. (previously presented) Apparatus according to claim 1, further comprising user profile generation and retrieval means for recording attribute data associated with inputs made by

individual users and using the attribute data to initialize further sessions operated by the same users.

9. (previously presented) A method of selecting items from a database, the method comprising steps of:

displaying a set of display items selected from a display database;

storing attribute data items each associated with one or more of the display items;

storing a score value for each of the attribute data items;

updating the display at intervals with new display items;

receiving user input, during a browsing session, identifying a first display item selected from the set of displayed items;

retrieving, from the data-storage means, attribute data items associated with the display item identified in the user input;

updating the score values of attribute data items in response to user input as said browsing session continues; and

continuing to update the display at intervals using the updated score values of attribute data items to bias the selection process during said browsing session.

10. (previously presented) A method according to claim 9, wherein the items selected for display are selected according to a process which uses the attribute data item scores to bias a probabilistic selection across the display items.

11. (previously presented) A method according to claim 9, wherein each attribute data item has a score value which is altered as said browsing session continues according to user interaction with display items.

12. (original) A method according to claim 11, wherein each display item is associated with a number of attribute data items, and where an aggregate score is created for that display item, using the score values of associated attribute data items.

13. (currently amended) A method Apparatus according to claim 11, wherein each display item is associated with a number of attribute data items, and where an aggregate score is created for that display item, using the score values of associated attribute data items; and  
wherein one or more of the display items may be selected using a probabilistic function, such that the aggregate score ~~of claim 10~~ determines the probability of its selection.

14. (previously presented) A method according to claim 9, wherein user-generated reward values in respect of selected display items are used to generate associated score values for the attribute data items associated with the display item, the score values being used to create an aggregate score for associated display items and hence bias the probabilistic selection process.

15. (original) A method according to claim 14, wherein the attribute data items are associated with the display items using real-value weights which modify the generation of score values and the creation of an aggregate score.

16. (previously presented) A method according to claim 9, where the changes to attribute data item score values are so arranged that the sum of score values across all attribute data items is zero.
17. (previously presented) A method according to claim 9, wherein reward values may take both positive and negative values.
18. (previously presented) A method according to claim 9 wherein reward values may accrue not only to attribute data items associated with a display item selected by the user, but also to attribute data items associated with display items which were available for selection in competition with the selected item either by being simultaneously present on the display means or by having been recently displayed.
19. (original) A method according to claim 18 wherein the reward accrued by attribute data items due to association with non-selected display items is negative where the selected display item reward is positive, and positive where the selected display item reward is negative.
20. (previously presented) A method according to claim 9, wherein the display includes non-visual elements.
21. (previously presented) A method according to claim 9, wherein user profiles are generated using the attribute data associated with the selections made by individual users.

22. (previously presented) A method according to claim 9 wherein a further set of display items exists which is not selectable by the user for amending the score values, the further display items being associated with attribute data items drawn from a set wholly or partly overlapping with the set of attribute data items associated with the interactive display items, the further display items being selected, according to the associated attribute data items, for display on a separate display means, or on a separate part of the display means used for interactive display items.

23. (previously presented) A method according to claim 9 wherein a user may initiate a further type of interaction, such as purchase or request for further information, by selection of display items.

24. (canceled)

25. (previously presented) A computer program product directly loadable into the internal memory of a computer, comprising software code portions for performing the steps of the method of claim 9 when the product is run on a computer.

26. (previously presented) A computer readable storage medium, tangibly embodying a program of instructions executable by a computer to perform steps comprising:  
causing the computer to generate a display of a set of display items selected from a display database;

causing the computer to store a set of attribute data items each associated with one or more of the display items;

causing the computer to store a score value for each attribute data item;

causing the computer to respond to an input, made during a browsing session, identifying a first display item, selected from the currently displayed set;

causing the computer to amend the score values in response to the input as said browsing session continues;

causing the computer to retrieve, from the data-storage means, attribute data items associated with the display item identified in the user input;

causing the computer to select one or more further display items in accordance with the score values associated with the retrieved attribute data items; and

causing the computer to generate a display of the selected further display items during said browsing session.

27-29. (canceled)

30. (previously presented) An apparatus according to claim 1, wherein the display items are displayed, prior to receiving said user inputs, at random.

31. (previously presented) A method according to claim 9, wherein the display items are displayed, prior to receiving said user input, at random.

32. (previously presented) A computer readable storage medium according to claim 26, wherein the display items are displayed, prior to receiving user inputs, at random.

33. (previously presented) An apparatus according to claim 1, wherein the sum of all score values remains the same value even after the score values are amended in response to the user inputs.

34. (previously presented) A method according to claim 9, wherein a sum of all score values remains the same value even after the score values have been updated in response to the user input.

35. (previously presented) A computer readable storage medium according to claim 26, wherein the sum of all score values remains the same value, even after the score values are amended in response to the user inputs.

36. (new) An apparatus according to claim 1 wherein score values may accrue not only to attribute data items associated with a display item selected by received user inputs, but also to attribute data items associated with display items which were available for selection in competition with the selected display item either by being simultaneously displayed or by having been recently displayed.

37. (new) An apparatus according to claim 36 wherein the score value accrued by attribute data items due to association with non-selected display items is negative where the

selected display item reward is positive, and positive where the selected display item reward is negative.

38. (new) A computer readable storage medium according to claim 26 wherein score values may accrue not only to attribute data items associated with a display item identified by the input, but also to attribute data items associated with display items which were available for selection in competition with the identified display item either by being simultaneously displayed or by having been recently displayed.

39. (new) An apparatus according to claim 38 wherein the score value accrued by attribute data items due to association with non-identified display items is negative where the identified display item reward is positive, and positive where the identified display item reward is negative.

40. (new) An apparatus according to claim 1, where the changes to attribute data item score values are so arranged that the sum of score values across all attribute data items is zero.

41. (new) A computer readable storage medium according to claim 26, where the changes to attribute data item score values are so arranged that the sum of score values across all attribute data items is zero.

42. (new) An apparatus according to claim 1, wherein at least one of the attribute data items is associated with more than one of the display items.

43. (new) A method according to claim 9, wherein at least one of the attribute data items is associated with more than one of the display items.

44. (new) A computer readable storage medium according to claim 26, wherein at least one of the attribute data items is associated with more than one of the display items.
